#### [2] Energy and Climate Change (EC)

##### [2.10] Greenhouse gas emission reduction program

User interface of the document management system used at Bursa Uludag University  
<https://udos.uludag.edu.tr/>

Electronic document management system to reduce the amount of paper, cartridge, and energy consumption as part of the greenhouse gas emission reduction program

The renovation of the central heating unit covers the conversion of existing boilers into condensing type boilers with premix burners. This renovation and the other renewals in the existing heating system will save a considerable amount of energy used for heating the buildings within the campus. This figure is an example to the boilers that is being planned to use.

Example to the energy-efficient boilers that will be used as part of the Central Heating Unit renovation project.

Heat recovery device used to save energy in air conditioners

#### Description:

1. Electronic document management system is used at Bursa Uludağ University to reduce the amount of paper, cartridge, and energy consumption as part of the greenhouse gas emission reduction program. The user interface of the document management system used at Bursa Uludağ University can be reached at <https://udos.uludag.edu.tr/>
2. The existing central heating system of the campus will be renovated as part of the greenhouse gas emission reduction program. The renovation of the central heating unit covers the conversion of existing boilers into condensing-type boilers with premix burners. This renovation and the other renewals (all of the pipes, valves, and pumps will be renovated as well) in the existing heating system will save a considerable amount of energy used for heating the buildings within the campus.
3. Heat recovery devices, which are mechanical ventilation devices designed to provide energy saving while achieving high indoor air quality in closed volumes, are used in air conditioners in buildings on campus. In order to use energy efficiently, thanks to the Energy Control feature, provides up to 60% energy savings, which can be adjusted according to the number of people in the room, temperature, and conditions.
